Abstract— This paper mainly focused on to assess the characteristic relationship and importance of physical facilities for under graduate students. A total no. of 45(28male and 17 female) students were selected at graduation level getting technical education and are academically good scholars to find out their opinion on the necessity of trust in any relationship as well as to know their opinion about role of physical facilities to fulfill the needs of relationship. A questionnaire was made to know their opinion and appropriate statistical hypothesis test over was performed to interpret the data. No significant difference was observed for male and female respectively. Near to same opinion was observed for the role of physical facilities to fulfill the relation with the value of 32.14% for males and 47.06% for females. As per real factors both male and female are having same potential and competence. Which directly or indirectly shows that both require mutual fulfillment of relationship with Elders as well as with younger and money/wealth or physical facilities are necessary in their life but that is not everything both males and females want to live with mutually fulfilling relation with other human beings.

Index Terms— Students, Awareness, Relations, Physical facilities, society

INTRODUCTION

The world is getting change at very rapid rate. Modernization and show of culture after globalization is bringing the world closer economically and increasing scarcity and struggle within the society. Modernization causes several conflict points around the world. The issue of climate change and overexploitation to nature is also staring at us in the face! India is both a beneficiary and a victim of the effects of modernization. India is emerging rapidly, but unless we are not careful this expansion is causes lack of regard for families and

spread discomfort. The drive for accumulation of physical facilities has become the sole goal of the young people, who are driven by their preconditioning to work within a competitive manner. There is much anxiety in family where there is a sacrifice among relationships and lack of right feelings is there. Trust is called the basic or the fundamental value and absolutely important. Trust is everything and we should try to nurture it. Relations are built on person to person basis, their perception about each other and the trust created in the process of action and reaction (Anand, 2011). People sense how you feel about them, If you want to change their attitudes towards you, change the negative attitudes you have toward them (Mehta, 2010).

This ultimate goal to work for the wellbeing of all (sarv-shubh): for a happy, peaceful and prosperous society of individuals living in harmony at all levels – from individual, to family, to society can be achieved by right understanding & right feeling (mutual happiness) in every individual, Prosperity in every family, Fearlessness in society, and, Co-existence in nature/existence. This is possible only if we give importance to all elder, younger without making differentiation as per age, post, class, sect. etc..

MATERIAL AND METHODS

The aim of the paper is to assess the characteristic relationship and importance of physical facilities among under graduates regular students with special reference to Technical colleges in Ghaziabad, Geographically situated in Lat. 28° 40' North and Long. 77° 25' East, 19 km. east of Delhi and 46 km. south-west of Meerut with which it is connected by a metal led road. Other roads lead west to Loni and

Baghpat and east to Hapur and Garhmukteshwar. A Questionnaire was made to assess the views of students and appropriate statistical hypothesis test over was performed to interpret the data.

OBJECTIVES

- To find out the opinion of college students for mutual fulfillment of relation with elder.
- To find out the opinion of college students for mutual fulfillment of relation with younger.
- To know the opinion of students about physical facilities and the need of relationship.

RESULT & DISCUSSION

During the present study opinions observed is presented on the basis of collected data with the help of tables. This also aims to do appropriate statistical test over the data to validate the statistical hypothesis which helps in interpreting data, to explain the opinion of college students about the trust, physical facilities and need of relationship.

Hypothesis 0: There is no significant difference between the opinion of male and female is observed

Hypothesis 1: There is significant difference between the opinion of male and female.

As per Table No:1

$$S.E = \sqrt{\frac{(0.51)^2}{17} + \frac{(0.79)^2}{28}} = \sqrt{0.01530 + 0.02229} = \sqrt{0.03759} = 0.19388$$

$$\frac{\text{difference}}{S.E} = \frac{4.41 - 4.11}{0.19388} = \frac{0.030}{0.19388} = 1.54735$$

Since the difference is less than 2.58 S.E (1% level of significance).

Hypothesis 0 is accepted

.Hence the difference in the mean life of the male and female makes is not significant.

This shows that there is no significant difference between the opinion of male and female.

As per table No:2

$$S.E = \sqrt{\frac{(0.51)^2}{17} + \frac{(1.00)^2}{28}} = \sqrt{0.01530 + 0.03571} = \sqrt{0.05101} = 0.22585$$

$$\frac{\text{difference}}{S.E} = \frac{4.41 - 4.04}{0.22585} = \frac{0.37}{0.19388} = 1.63826$$

Since the difference is less than 2.58 S.E (1% level of significance).

Hypothesis 0 is accepted.

Hence the difference in the mean life of the male and female makes is not significant.

This shows that there is no significant difference between the opinion of male and female.

As per table No:3

$$S.E = \sqrt{\frac{(0.99)^2}{17} + \frac{(0.90)^2}{28}} = \sqrt{0.05765 + 0.02893} = \sqrt{0.08658} = 0.29425$$

$$\frac{\text{difference}}{S.E} = \frac{4.29 - 4.00}{0.29425} = \frac{0.29}{0.29425} = 0.98556$$

Since the difference is less than 2.58 S.E (1% level of significance).

Hypothesis 0 is accepted.

Hence the difference in the mean life of the male and female makes is not significant.

This shows that there is no significant difference between the opinion of male and female.

Table No:1 Group Statistics between male and female

S. No.	Gender	Mean	Standard Deviation	N
1	Male	4.11	0.79	28
2	Female	4.41	0.51	17

Table No:2 Group Statistics between male and female

S. No.	Gender	Mean	Standard Deviation	N
1	Male	4.04	1.00	28
2	Female	4.41	0.51	17

Table No:3 Group Statistics between male and female

S. No.	Gender	Mean	Standard Deviation	N
1	Male	4.00	0.90	28
2	Female	4.29	0.99	17

RECOMMENDATION AND CONCLUSIONS

This study is helpful to find out the answers for questions whether college students are aware of right feelings and right understanding or not .If they are

aware how they are practicing in their day to day life. It was observed with answers in the above mentioned questions which support of primary data collected shows that gender does not influence right feelings and right understandings. Which means irrespective of gender college students are aware about the same. As a result of mistaken assumption of us being only the body and the relationship with others being only at level of body, we have reduced our expectations in relationships to the mere fulfillment of physical facilities. We evaluate all our relationships in terms of material things like money, property and the purpose of relationship has been reduced to physical and material needs and its exchange. Therefore what we need first is the right understanding and this right understanding is not ensured by having money. Secondly we need the feelings in relationship to be fulfilled, which is also not ensured by having money/physical facilities.
