Abstract—**This paper introduces Residencify, an innovative full-stack system meticulously designed to revolutionize the villa and house booking and hosting experience. Recognizing the growing demand for unique, personalized accommodations and the complex operational challenges faced by property owners, Residencify provides a comprehensive, dual-sided platform. It addresses critical user needs such as finding reliable, detailed listings for private residences, ensuring secure booking processes, and facilitating clear communication..**

Index Terms—Villa Booking, House Rental, Hosting Platform, MERN Stack, Online Accommodation, Property Management, Peer-to-Peer Hospitality, User Experience..

I. INTRODUCTION

The global travel and hospitality landscape has undergone a profound transformation, driven significantly by a shift in traveler preferences towards more authentic, private, and localized accommodation experiences. No longer are hotels the sole option; the burgeoning market for villas, private houses, and unique residential rentals has captured the imagination of travelers seeking flexibility, space, and a personal touch.

II. PROCEDURE FOR PAPER SUBMISSION

A. The Scrutiny Stage
Embark on your submission journey by presenting your manuscript electronically for thorough peer review. Prepare your work meticulously in a two-column format, ensuring all figures and tables are integrated seamlessly, maintaining absolute clarity and readability, adjusting layout only when the integrity of the data demands it.

B. The Culmination Stage
Upon receiving the esteemed confirmation of your manuscript's acceptance, a crucial final step awaits. Authors of these distinguished works will be provided with a mandatory copyright agreement, which must accompany your conclusive submission, solidifying its place within our esteemed publications.
form and the form should accompany your final submission.
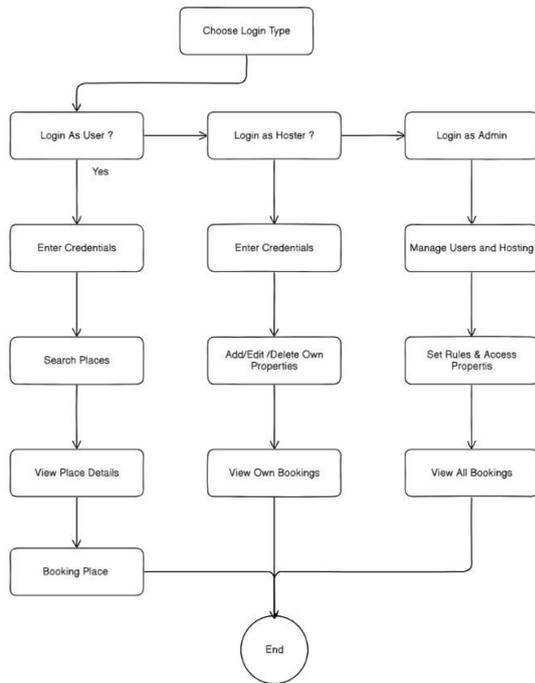

III. MATH

When incorporating mathematical equations into your paper, leverage either Microsoft Equation Editor or the Math Type add-on for precise formatting. Ensure the "Float over text" option remains unselected for proper placement..

IV. STANDARDIZED MEASUREMENT UNITS

For clarity and consistency within your manuscript, primarily adopt either the International System of Units (SI, or MKS) or the CGS system, with a strong recommendation for SI units. English units are permissible as secondary references, enclosed in parentheses, especially for data storage contexts (e.g., "15 Gb/cm² (100 Gb/in²)"). An exception applies when English units serve as direct trade identifiers, such as "3½ inch disk drive." Critically, avoid intermingling SI and CGS units within the same expression to prevent dimensional imbalance and confusion; should mixed units be unavoidable, explicitly declare the units for each quantity in your equations. When referring to magnetic field strength, the SI unit is A/m; if employing Tesla (T), refer to magnetic flux density (B) or $\mu_0 H$. Remember to use a center dot ($\cdot$) to delineate compound units (e.g., "A·m²").

V. HELPFUL HINTS

A. Figures and Tables

B. References

Ensure all references are cited consecutively using square brackets, with the sentence punctuation following the closing bracket (e.g., [1]). For multiple citations, each reference should reside within its own set of brackets (e.g., [2], [3]), or for a range, use a single set (e.g., [1]–[3]). When quoting from a book, include specific page numbers within the brackets [2]. Within sentences, refer directly to the numerical citation (e.g., "as in [3]"), reserving the full "reference [3]" phrase exclusively for sentence beginnings. Footnotes are to be numbered separately using superscripts and placed at the bottom of the citing column, distinct from the main reference list; utilize letters for table-specific footnotes. The preferred reference style is exemplified at the document's conclusion, requiring all authors' names to be listed unless six or more are present, in which case "et al." may be used. Ensure a space follows each author's initial. Unpublished works should be clearly identified as such [4]

C. Abbreviations and Acronyms

Upon their initial appearance within the main body of your manuscript, all abbreviations and acronyms must be explicitly defined, even if they have been previously elucidated in the abstract. Common scientific abbreviations such as SI, ac, and dc are exempt from this requirement. Abbreviations that incorporate periods should be presented without internal spaces (e.g., "C.N.R.S."). It is strongly advised to avoid using abbreviations within the paper's title unless their inclusion is absolutely indispensable, as exemplified by journal titles like "INTERNATIONAL JOURNAL OF INNOVATIVE RESEARCH IN TECHNOLOGY" in article headers.

D. Equations

All equations within your paper should be numbered consecutively with their respective equation numbers enclosed in parentheses, flush with the right margin (e.g., (1)). Begin by constructing your equation using the designated equation editor, then apply the "Equation" markup style. Following this, use the tab key to insert the equation number in parentheses. For enhanced compactness, you may employ the solidus (/), the exp function, or appropriate exponents, always utilizing parentheses to resolve any potential ambiguities within denominators. Crucially, punctuate equations as if they are integral components of a sentence, as demonstrated by the example:

$$\int_0^F(r,j)drdj = [sr2/(2m0)] \qquad (1)$$

Ensure that all symbols introduced in your equations are thoroughly defined either prior to their appearance or immediately thereafter. Remember to italicize symbols (e.g., T for temperature, distinct from T as the unit tesla). When referencing equations in the text, simply use the number in parentheses (e.g., "(1)"), reserving phrases like "Equation (1)" only for the beginning of a sentence.

VI. PUBLICATION PRINCIPLES

The foundational ethos of this journal rests on the principles of peer-reviewed and archival scholarly content. Dedicated to advancing knowledge, the International Journal of Innovative Research in Technology actively publishes insightful articles of enduring academic value, alongside comprehensive

tutorial expositions and astute critical reviews. These encompass both classical subjects and topics of contemporary relevance, contributing to the rich tapestry of technological discourse

1. Advancement of Knowledge: Submissions are expected to genuinely push the boundaries of current understanding. It is imperative that your work not only presents novel insights but also thoughtfully references existing scholarly

contributions to position your research within the broader academic discourse.

2. Proportionality of Content: The length of your manuscript should organically reflect the significance and inherent complexity of your research. Simple extensions of prior work, for instance, might not warrant a full paper or could be adequately conveyed within a more concise format. The depth should match the impact.

3. Demonstrating Merit: It is the author's responsibility to compellingly articulate the scientific and technical excellence of their paper to both peer reviewers and the editorial board. When reporting extraordinary or unexpected findings, the evidentiary bar for proof is proportionally elevated, demanding rigorous substantiation.

4. Enabling Replication and Utility: Fundamental to scientific progress is the ability to replicate results. Therefore, your submitted paper must furnish sufficient details to empower other researchers to reproduce similar experiments or calculations, or effectively apply your reported findings. While not every minute detail requires disclosure, the manuscript must undeniably offer new, practically usable, and thoroughly described information. Anticipate rigorous scrutiny from reviewers if your conclusions lack robust data or critical explanatory specifics.

VII. CONCLUSION

While a dedicated conclusion section is not strictly mandatory, if you choose to include one, ensure it serves as more than a mere reiteration of your abstract. Instead, this section should be an opportunity to expand upon the profound implications of your work, highlight its significance, or thoughtfully propose potential applications and avenues for future extensions.

APPENDIX

Should supplementary materials or expanded details be necessary, any Appendices must be strategically positioned directly preceding the Acknowledgment section within your paper.

ACKNOWLEDGMENT

When preparing this section, please note the preferred American English spelling of "acknowledgment" omits the "e" after the "g." Utilize a singular heading, even if you have numerous acknowledgments. To maintain a direct and professional tone, avoid impersonal phrases such as "One of us (S.B.A.) would like to thank..." Instead, opt for a straightforward expression like "F.A. Author thanks..." Any acknowledgments regarding sponsor or financial support should be placed as an unnumbered footnote on the paper's first page, rather than within this section.
