²Associate Professor & Guide, Dept. of Dravyaguna Vigyana, National Institute of Ayurveda, Jaipur

Abstract—Background:The heart, regarded in *Ayurveda* as a vital organ responsible for the circulation of *Rasa* (nutrient essence), requires careful preservation to prevent dysfunction. *Ayurveda* emphasizes stress reduction and a heart-supportive diet as central to maintaining cardiovascular health. This paper explores the *Ayurvedic* perspective on heart failure with reduced ejection fraction (HFrEF). Low ejection fraction (EF), defined as EF below 55%, signifies impaired cardiac efficiency. Heart failure is a leading contributor to premature mortality due to cardiac dysfunction. According to *Ayurveda* principles, heart dysfunction primarily stems from impaired *Rasadhatvagni* (digestive/metabolic function of the *Rasa Dhatu*), leading to the formation of poor-quality *Rasa Dhatu*, which, when accumulated, adversely affects cardiac function.

Case Presentation:This case report presents a 47-year-old male diagnosed with heart failure with reduced ejection fraction (LVEF 23%), attributed to defective *Rasa Dhatu* formation. The patient was treated with a *shaman chikitsa* aimed at improving both systolic and diastolic cardiac function. These formulations were selected based on their *Hridya* (cardiotonic), *Rasayana* (rejuvenative), and *Agni-deepana* (digestive fire-enhancing) properties.

Results:The patient showed marked clinical and echocardiographic improvement. The LVEF improved from 23% to 35%, along with normalization of pulmonary artery pressure, improved right ventricular function, and reduction in pericardial effusion. The findings suggest that correction of *Rasa Dhatu* quality through *Ayurvedic* interventions contributed to the improvement in cardiac function.

Conclusion:This case highlights the potential of *Ayurvedic* interventions specifically targeted *shaman chikitsa* in improving cardiac function in patients with low ejection fraction. *Ayurveda* offers a scientifically grounded and holistic approach that can be used either as a standalone therapy or as an adjunct to conventional cardiology practices.

Index Terms—Heart failure, low ejection fraction, *shamana chikitsa*, *Ayurveda*

I. INTRODUCTION

Heart failure (HF) is a complex clinical syndrome affecting approximately 2% of the adult population worldwide and remains a leading cause of early morbidity and mortality. Despite advancements in pharmacological and instrumental therapies, chronic heart failure continues to carry a significant burden. The first-year mortality rate among hospitalized patients with acute decompensated heart failure can be as high as 25%. ¹Furthermore, the prognosis for patients who develop cardiogenic shock following acute myocardial infarction has not improved substantially over the past two decades, even with the advent of reperfusion therapies and mechanical circulatory support (MCS) ^{2,3}.

In *Ayurveda* medicine, heart failure is considered a *Tridoshaja Vyadhi*, involving the imbalance of all three *doshas* (*Vata*, *Pitta*, and *Kapha*), and is often linked to impaired *Rasa Dhatu* metabolism and dysfunction of *Rasadhatvagni*. While modern management of HF has advanced considerably, outcomes in terms of patient survival and quality of life remain suboptimal.

Recent clinical trials have explored the role of *Ayurveda* interventions as adjunct therapies in the management of heart failure. Several herbal formulations possess documented antioxidant, anti-inflammatory, antiplatelet, and hypolipidemic properties, which may be beneficial in improving cardiac function and reducing cardiovascular risk^{4,5}. However, more clinical evidence is needed to substantiate their therapeutic potential in routine practice.

This case report presents the integrated management of heart failure with reduced ejection fraction in a 47-year-old male patient with associated comorbidities. It managed exclusively with *Ayurveda* interventions and

lifestyle modifications for 9 months; the patient was subsequently treated exclusively with *Ayurveda* interventions and lifestyle modifications. This treatment was administered at the National Institute of *Ayurveda*, Jaipur, and led to notable clinical and echocardiographic improvements, underscoring the potential of *Ayurveda* in managing heart failure with low ejection fraction.

Case Report:

A 47-year-old male patient presented to the Outpatient Department of *Dravyaguna Vigyana*, National Institute of *Ayurveda*, Jaipur, on 25-07-2024 with chief complaints of breathlessness, reduced appetite, vertigo, generalized body ache, and bilateral pedal edema, all persisting for approximately one month.

At the time of presentation, his vital signs were as follows:

Weight: 72 kg

Temperature: 98.4°F

Respiratory Rate: 22 breaths per minute

Blood Pressure: 140/90 mmHg

Pulse Rate: 64 beats per minute

Physical Examination

General examination revealed the presence of a coated tongue and bilateral pitting edema of the feet. However, there was no pallor, cyanosis, or clubbing observed.

Central Nervous System (CNS): Patient was drowsy but responsive.

Cardiovascular System (CVS): Heart sounds S1 and S2 were audible; a loud murmur was noted.

Respiratory System (RS): Bilateral air entry was noted.

Per Abdomen (PA): Abdomen was soft and non-tender.

Cardiac Rhythm: Sinus rhythm was observed.

The patient had no prior history of heart failure or significant cardiac illness.

Investigations

Echocardiography revealed significant systolic and diastolic dysfunction, with a left ventricular ejection fraction (LVEF) of $23 \pm 3\%$, indicating severe LV systolic dysfunction.

Treatment Protocol:

During the course of treatment, the patient was placed on a structured integrative regimen that included *Ayurveda* medications, dietary modifications, lifestyle interventions, a disciplined daily routine (*Dinacharya*), and *yoga* therapy.

Diet and Lifestyle

The patient was advised to follow a regulated daily routine (*Dinacharya*) with fixed meal timings and specific dietary restrictions. Meals were limited to two per day:

First meal: Between 9:00 a.m. and 11:00 a.m.

Second meal: Between 6:00 p.m. and 8:00 p.m.

The following dietary guidelines were strictly followed:

A potassium-rich diet, including ample fresh fruits and vegetables.

Elimination of junk, fast, fermented, fried, and heavy oily foods.

Avoidance of high-sodium items such as potatoes and processed foods.

In addition, the patient was advised to engage in light physical activities and follow a *yoga* routine designed for cardiac rehabilitation. The *yoga* regimen included gentle *asanas*, *pranayama* (breathing techniques), and relaxation practices to improve parasympathetic tone, support emotional balance, and reduce cardiac stress.

Ayurvedic Medications

The following herbs and formulations were administered to support cardiac function, enhance *Rasa Dhatu* metabolism, and restore *Dosha* equilibrium associated with heart dysfunction:

1. *Arjunarishtha*^{6,7}

Dosage: 20 ml twice daily after meals, with an equal quantity of plain water

Properties: *Hridya* (cardiotonic), *Kaphavataghna*, *Rasayana*

Mechanism: Strengthens cardiac musculature, improves coronary perfusion, and enhances left ventricular systolic function.

2. *Amritadi Guggulu*⁸

Dosage: 1 g twice daily after meals

Properties: *Tridoshahara*, *Lekhana*, *Raktashodhaka*

Mechanism: Aids in reducing lipid levels, supports metabolic detoxification, and modulates vascular inflammation.

3. *Ashwagandha* powder (*Withania somnifera*)⁹

Dosage: 1 g twice daily after meals

Properties: *Balya, Rasayana, Medhya*

Mechanism: Acts as an adaptogen, improves muscle strength, reduces cortisol levels, and supports myocardial recovery.

4. *Tambula Patra* (Betel Leaf)¹⁰

Dosage: 1 fresh leaf, twice daily after meals

Properties: *Dipana, Hridya, Krimighna*

Mechanism: Enhances digestion, reduces *Ama* (metabolic waste), supports vascular tone, and aids peripheral circulation.

5. *Shuddha Shilajit*¹¹

Dosage: 125 mg once daily

Properties: *Rasayana, Balya, Agnideepana*

Mechanism: Boosts mitochondrial function, enhances physical stamina, and strengthens cardiac endurance.

These medications were carefully chosen based on classical *Ayurveda* references and customized according to the patient's individual constitution (*Prakriti*), digestive status (*Agni*), tissue channel involvement (*Srotodushiti*), and derangement of *Rasa Dhatu*.

Follow-up and outcome:

The patient was assessed at regular follow-up visits, and symptoms were monitored throughout the nine months treatment period.

II. OBSERVATION AND RESULTS

| Symptoms | Before treatment | After nine months of treatment |
|-----------------------|------------------|--------------------------------|
| breathlessness | severe | absent |
| vertigo | present | absent |
| Bilateral pedal edema | present | absent |
| Reduced appetite | present | Normal |
| Generalized body ache | present | absent |

ECHOCARDIOGRAPHY & COLOR DOPPLER REPORT

NAME : [REDACTED] DATE : 19th July 24
AGE / SEX : 47 Yrs / M REG. NO. :

Quality of Imaging : Good / Fair / Poor. Rhythm irregular.

| MEASUREMENTS | ABSOLUTE VALUE | NORMALS (Adult) |
|--------------------------|-------------------|-----------------|
| Aortic Root Diameter | 33.6 | 20 - 37 mm |
| Aortic Valve Opening | 15.9 | 15 - 26 mm |
| Left Atrial Dimension | 48.2 | 19 - 40 mm |
| RV Dimension (basal) | Dilated | 20 - 28 mm |
| RV Thickness | N | 03 - 05 mm |
| LV ED Dimension | 59.6 | 37 - 56 mm |
| LV ES Dimension | 52.9 | 22 - 40 mm |
| IVS Thickness | ED- 10.6 ES- 11.3 | 06 - 11 mm |
| LVPW Thickness | ED- 10.6 ES- 11.9 | 06 - 11 mm |
| IVS / LVPW Ratio | N | < 1.25 |
| Pulmonary Artery | 24.3 | 15 - 21 mm |
| Inferior Vena Cava | 23.1 | 12 - 17 mm |
| IVC inspiratory collapse | < 50 % | > 50 % |

| INDICES OF LV FUNC. | | |
|----------------------|--------|-----------|
| EPSS | - | < 9 mm |
| FS % | 11 | 24 - 42 % |
| LV Ejection fraction | 23 ± 3 | 60 ± 6 % |

M MODE / 2D IMAGING:

- LV dilated in size. No concentric LVH. Poor contractility. No thrombus.
- LA dilated in size. No LA clot.
- RV & RA dilated in size. RV contractility markedly reduced (TAPSE 08 mm).
- Mitral valve leaflets and motion normal. No annular calcification.
- Normal tricuspid & pulmonary valves.
- Aortic valve tricuspid. Leaflets normal with normal opening.
- IAS accessible by TTE & IVS appear intact. No PDA.
- Mild pericardial effusion measuring up to 7.5 mm posteriorly towards right.

After treatment (nine months)

Comparative Echocardiography Report: Before and After Treatment

The echocardiographic evaluation before and after treatment shows significant improvement in overall cardiac function, with some residual structural changes. Below is a comparative analysis in narrative form:

Left Ventricle (LV)

Before treatment, the left ventricle was dilated in size with severe global hypokinesia, and the left ventricular ejection fraction (LVEF) was markedly reduced to $23 \pm 3\%$, indicating severe systolic dysfunction. After treatment, the LV remained enlarged, but there was notable improvement in systolic function. The LVEF improved to 35%, suggesting moderate systolic dysfunction. Contractility also improved, changing from severe to moderate global hypokinesia. Additionally, Grade I diastolic dysfunction was noted post-treatment, indicating mild residual diastolic impairment that was not previously documented.

Left Atrium (LA)

Initially, the left atrium was dilated with no thrombus observed. Post-treatment, it remained enlarged, but no further complications such as clot formation were reported. This suggests a stable structural change without acute pathology.

Right Ventricle (RV) and Right Atrium (RA)

Prior to treatment, both the right atrium and right ventricle were dilated. The RV showed markedly reduced contractility, with TAPSE (tricuspid annular plane systolic excursion) measured at only 8 mm, indicating severely impaired right ventricular

function. After treatment, the sizes of both RA and RV returned to normal, and RV function improved to a fair level. This reflects a positive response in right heart dynamics.

Valvular Findings

Initially, the mitral and aortic valves showed normal leaflet motion and structure, while the tricuspid and pulmonary valves appeared normal as well. Mild to moderate mitral regurgitation and moderate tricuspid regurgitation were observed. After treatment, the mitral and aortic valves appeared thickened, suggesting mild structural change or degenerative alteration. However, the degree of regurgitation significantly reduced to trivial mitral and tricuspid regurgitation, indicating improved valvular competence.

Pulmonary Artery Pressure (PAP)

Before treatment, pulmonary artery pressure was elevated at 44 mmHg plus right atrial pressure, reflecting moderate pulmonary hypertension. After treatment, the pulmonary artery systolic pressure decreased to 25 mmHg (PASP = RAP = 15 + 10 mmHg), which is within normal limits. This suggests significant relief in pulmonary pressures likely due to improved ventricular function and reduced regurgitant volume.

Pericardial Effusion

A mild pericardial effusion measuring up to 7.5 mm posteriorly toward the right was noted before treatment. After treatment, only a minimal effusion was seen, measuring approximately 4 mm laterally and medially, with no signs of cardiac tamponade.

This indicates a reduction in pericardial fluid and no hemodynamic compromise.

Septal Integrity and Congenital Defects

Throughout both evaluations, the interatrial and interventricular septa appeared intact, with no signs of atrial septal defect (ASD), ventricular septal defect (VSD), or patent ductus arteriosus (PDA). While the transthoracic echocardiogram (TTE) findings were negative for such defects, a transesophageal echocardiogram (TEE) was suggested for confirmation, especially if clinically indicated.

Overall Interpretation

There has been a notable improvement in cardiac function following treatment. The LVEF improved from 23% to 35%, indicating enhanced left ventricular systolic function. Right ventricular function recovered significantly, and the chamber dilatation in RA and RV resolved. Valvular regurgitations diminished, and pulmonary artery pressure normalized, reflecting reduced cardiac strain. Pericardial effusion also decreased, suggesting improved pericardial dynamics. However, left atrial and left ventricular enlargement persisted, and mild structural changes in the mitral and aortic valves were observed. A low-grade diastolic dysfunction also became apparent. These residual findings warrant continued follow-up but do not overshadow the substantial clinical and echocardiographic improvements achieved with treatment.

III. RESULT AND DISCUSSION

1. *Arjunarishtha*

Main Ingredient: *Terminalia arjuna*

Used as: Cardiac tonic (*Hridya*), *Rasayana*

Rasa: Kashaya (astringent), *Tikta* (bitter)

Guna: Laghu (light), *Ruksha* (dry)

Virya: Sheeta (cold)

Vipaka: Katu (pungent)

Karma: Hridya (cardiotonic), *Rakta Shodhaka* (blood purifier), *Deepana* (appetizer), *Balya* (strength-giving), *Rasayana* (rejuvenator)

Relevance to HFrEF:

Improves cardiac contractility, Reduces myocardial ischemia, Acts as antioxidant and hypolipidemic

2. *Amritadi Guggulu*

Key Ingredients: *Guduchi* (*Amrita*), *Guggulu*, *Triphala*, etc.

Primarily used in inflammatory conditions, chronic systemic disorders, and *rasayana* therapy.

Rasa: Tikta (bitter), *Kashaya* (astringent), *Katu* (pungent)

Guna: Laghu (light), *Ruksha* (dry), *Tikshna* (penetrating)

Virya: Ushna (hot)

Vipaka: Katu

Karma: Rasayana (rejuvenator), *Lekhana* (scraping lipid plaques), *Ama-pachana* (removes endotoxins), *Medohara* (anti-obesity). *Hridya* (supports heart)

Relevance to HFrEF:

Reduces lipid-related atherosclerosis, Enhances microcirculation and metabolism, Modulates immune inflammation

3. *Ashwagandha* (*Withania somnifera*)

Used as: *Rasayana*, adaptogen, *medhya*

Rasa: Madhura (sweet), *Tikta* (bitter)

Guna: Guru (heavy), *Snigdha* (unctuous)

Virya: Ushna (hot)

Vipaka: Madhura

Karma: Balya (strength-giving), *Rasayana* (rejuvenator), *Hridya* (cardiac tonic), *Medhya* (neurotonic), *Brimhana* (nourishing)

Relevance to HFrEF:

Reduces stress and cardiac workload, Improves cardiac muscle tone, Enhances mitochondrial energy and tissue oxygenation

4. *Tambula Patra* (Piper betle – Betel leaf)

Traditionally used in: digestion, circulation, local stimulation

Rasa: Katu (pungent), *Tikta* (bitter)

Guna: Laghu (light), *Tikshna* (sharp), *Ruksha* (dry)

Virya: Ushna (hot)

Vipaka: Katu

Karma: Hridya (cardiac stimulant), *Vata-kaphahara*, *Deepana* (appetizer), *Krimighna* (antimicrobial)

Relevance to HFrEF: Acts as cardiac stimulant, Improves peripheral circulation, Reduces *Kapha*-induced fluid retention

5. *Shuddha Shilajit*

Used in: *Rasayana* therapy, metabolic and urogenital conditions

Rasa: Tikta (bitter), *Katu* (pungent)

Guna: Laghu (light), *Ruksha* (dry)

Virya: Ushna (hot)

Vipaka: Katu

Karma: Rasayana (rejuvenator), *Yogavahi* (enhancer of drug delivery), *Hridya* (supports heart function), *Medohara* (lipid-modulator), *Balya* (strength promoter)

Relevance to HFrEF: Enhances cellular ATP production, Improves myocardial endurance, Removes oxidative stress.

So, it can be considered that these medicines by the above-mentioned properties, breaks down the *Samprapti* (pathogenesis) of the disease heart failure with low ejection & fraction and improves the diseased condition.

IV. CONCLUSION

According to *Ayurveda* principles, dysfunction of *Rasadhatvagni* leads to the formation of poor-quality *Rasa Dhatu*, which can become a key factor in the pathogenesis of heart disorders. In the present case, impaired *Rasa Dhatu* was identified as the underlying cause of heart failure with reduced ejection fraction (HFrEF).

The *Ayurveda* management, particularly through *Shamana Chikitsa* using selected cardioprotective herbs, showed promising results in improving both systolic and diastolic dysfunction. The herbal formulations prescribed in this case played a pivotal role in restoring cardiac function, enhancing *Rasadhatu* quality, and strengthening the heart muscle through their *Hridya*, *Rasayana*, and *Tridosahara* properties.

This case report highlights the therapeutic potential of *Ayurveda* interventions in managing heart failure and suggests that patients with HFrEF can benefit significantly from adjunctive cardiac support offered by herbal medicine. Furthermore, it underscores the importance of individualized treatment approaches based on *Ayurveda* diagnostics.

The outcomes of this case support the view that *Ayurveda* is a well-established, evidence-informed system of medicine with a strong theoretical foundation and practical applicability. It can serve as an effective stand-alone or integrative approach alongside conventional medical care for complex conditions like heart failure.

This report may serve as a valuable reference for *Ayurveda* practitioners, students, researchers, and

integrative health professionals committed to exploring holistic and patient-centered cardiovascular care.
