***Abstract*—The rapid growth of digital platforms has created new opportunities for connecting buyers and sellers in various domains, including pet adoption and pet care. Zuffie: The Pet World is a web-based platform designed to simplify the process of buying, selling, and adopting pets such as dogs and cats. The system allows pet owners to list their pets for sale or adoption, while interested buyers can browse available pets and send requests to the owners. Once a request is received, the pet owner can review and confirm the request, enabling a secure and structured interaction between both parties. This approach helps reduce the difficulties people face in finding trustworthy sources for pets and improves transparency in the pet exchange process.**

In addition to facilitating pet transactions, the platform also supports social responsibility by integrating Non-Governmental Organizations (NGOs) into the system. NGOs can donate pets for adoption or place pets on the platform to help them find suitable homes. Users can also contribute through donations to support these organizations and promote animal welfare. By combining pet marketplace functionality with NGO support.

Zuffie: The Pet World aims to create a reliable and responsible ecosystem that encourages ethical pet ownership, promotes adoption, and provides a convenient digital solution for pet lovers and animal welfare organizations.

***Index Terms*—Pet Marketplace, Online Pet Buying and Selling, NGO Support, Animal Welfare, Role-Based Access Control (RBAC), Digital Platform, Pet Request System, Ethical Pet Ownership, Digital Portfolio.**

I. INTRODUCTION

Pets now are a significant aspect of various households because they bring a sense of companionship, emotional support and security. The number of pets in the market like dogs, cats among other domestic animals has been on the rise in the recent years. Conventionally, individuals purchase or take pets using local breeders, pet stores, or acquaintances, which is not always transparent and reliable. In most circumstances, customers experience complications in identifying reliable pet owners or sources of verification. Meanwhile, a great number of animal shelters and Non-Governmental Organizations (NGOs) are engaged in saving lives of abandoned or injured animals and attempting to offer them safe homes.

Nevertheless, these organizations usually have difficulties in accessing a larger population of people interested in adopting pets. The absence of a quality digital platform leads to the existence of many animals that cannot be adopted by appropriate people because they are still in shelters. As the internet technology and web-based applications develop very swiftly, the web-based platforms can be used to easily connect people in various places. This process can be simplified and made more transparent and accessible by a digital system that incorporates pet buying, selling and adoption services. This idea is the basis of the creation of the concept of Zuffie: The Pet World. The modern-day digital age has caused a great transformation in the way individuals purchase and sell goods and services through online platforms and e-commerce systems.

The pet adoption and pet marketplace industry can also have an analogous technological approach to facilitate the process and make it more efficient and available to more people. The general difficulties encountered by many people willing to adopt or even buy pets are scarcity of information, unverified sellers and inability to reach out to pet owners. Meanwhile, a high number of pet owners have difficulties with locating responsible buyers or pet

adopters. These challenges can be reduced by launching a specific digital platform where people will be able to place pets in one place, have access to pets available, and place requests in a structured form. This online practice enhances ease, openness, and confidence among consumers and motivates more individuals to adopt pets in a responsible and ethical way.

Purchasing, selling and adoption of pets is not very structured in most regions. The vast majority of the population refers to pet stores and breeders in search of the animals they desire to purchase. However, in most cases these locations do not provide clear information on the pets and their owners. Due to this reason, buyers have no idea where they can acquire genuine and reliable pets. It has also been observed that there is no one place where people owning pets and potential buyers can easily meet and discuss the pets being sold. This has made the pet owners struggle to find the correct buyers of their pets as a majority of buyers do not have genuine interest in buying pets.

Buyers have also had a hard time locating the right pets that suit their needs and requirements. It is also observed that other pet related organizations that rescue these rescued pets are also facing some challenges. Finding new homes of these pets has proved to be a challenge as most people do not have the information that these pets are on sale. These pets are held in shelters long enough due to the lack of information about these pets. Besides, one can also find a shortage of integrated donation systems that can enable people to contribute to NGOs dealing with animal welfare. A digital platform, uniting the pet buyers, pet owners, and NGOs and offering them a structured system of listing the pets, managing the requests, adopting, and supporting the donation process is necessary to eliminate these problems. The Zuffie: The Pet World platform will help address such issues by building an effective and convenient setting to conduct pet-related activities.

II. LITERATURE REVIEW

The availability of web technologies and mobile applications has made it easier to create digital platforms that have the capacity to streamline various processes in real life. There are also researchers in the field of animal welfare and pet adoption who have put forward systems to facilitate animal shelters, pet owners, and individuals who are willing to adopt pets to interact via online systems. The old model of adoption entails visiting the animal shelters physically or seeking such adverts in the locality, which is time-consuming and inefficient.

Evidence has been provided regarding studies that can significantly enhance the exposure of animals on the adoption platform and adoption rates. According to a study of the Pet Adoption Portal systems, online platforms have the capacity of assisting potential adopters in finding animals based on their profiles, search, and communication facilities which may simplify the process of adoption making it more transparent. The studies of web-based pet adoption systems have demonstrated that the integration of contemporary web-based technologies may provide an opportunity to users to search available pets, make adoption requests, and communicate with shelters in a more effective way. These platforms will also help decrease the manual work and enhance pet information management. The other studies done have been directed at developing mobile applications that offer pet adoption and pet care services where the users can access the information about pet, adoption, and pet care services via user-friendly interface. The application assists in creating a trustful atmosphere between owners and adopters of pets.

Moreover, the existing research has demonstrated that other services like donation can be integrated by use of digital platforms, to the advantage of animal welfare organizations. The systems can enhance the effectiveness of adopting pets and facilitation between the adopters and shelters. Based on the researches carried out it is clear that technology can be very important in enhancing the process of pet adoption, responsible ownership of pets and locating the appropriate homes to the pets.

2.1 Review of Existing Systems.

A number of internet systems have been created to support pet adoption and animal welfare practices. The systems have been developed such that its prospective adopters are linked to animal shelters or pet owners.

The Pet Adoption Website is one of the online systems that have been generally created to ensure pet adoption. This system provides a comprehensive database about pets in terms of breed, age, and medical history. This system makes the process of finding the desired pets easy by potential adopters since they can find them according to their species, age, and location. The other online application that has been created to enable pet adoption is the Animal Adoption Mobile Application. The system acts to match the animal shelters and the potential adopters in a centralized manner. With this system, one is able to gain easy access to information about available pets and request adoption as well as get notified about their adoption status. The system is designed in such a way that users are in a position to interact with the system with ease in their mobile devices.

A study on the application of technology in adoption of pets has been done, as well. As an example, there are research studies that have been conducted in order to analyze the information of pets to make predictions on how quick a pet can be adopted according to its features. Moreover, pet adoption sites can also be considered as having certain functionality such as pet listing, communication and donation management, which can assist to build the trust between pet adopters and owners, and animal welfare organizations.

III. SYSTEM OVERVIEW AND PLANNING

3.1 Overview of Zuffie: The Pet World

The Pet World Zuffie is an online avoiding the usual process of purchasing, selling and adoption of pets. As a matter of fact, individuals are forced to visit the local pet stores or breeders or even social media platforms to get a pet. This is not an effective method of acquiring a pet since the information of the pet or the owner could not be genuine. The right pet might not be found by the buyer and the right owner might not be found by the buyer. Because of this, the pet exchange process is made confusing and disorganized. Zuffie online platform will enable the avoidance of these issues since all users will be connected using a single online platform. The buyer will be in a position to search through the available pets and select those which they are interested in. When the buyer has selected a pet that they are interested in, he/she can request the pet owner via the online system. The request will be next sent to the owner, and he or she will decide to accept it or reject it. This will make sure that both parties are properly communicating. The other notable point of the system is the involvement of NGOs and animal welfare organizations. It is a well-known fact that numerous NGOs save abandoned or wounded animals and strive to find them a safe haven. Nevertheless, these organizations have been identified to encounter difficulties in accessing many possible adopters. The Zuffie system allows NGO to put rescued pets on the list of available pets in order to be adopted by the users easily and provide them with a new permanent home.

There is also a donation service in the system that enables the user to contribute money to the Non-Governmental Organizations that deal with animal welfare. The donation service assists the NGOs to feed, shelter, and treat the rescued animals through medical attention. Therefore, the system does not only offer a marketplace of pets, but it also offers social causes regarding animal protection and care. Overall, Zuffie: The Pet World is a straightforward and well-structured system that allows connecting pet owners, buyers, and NGOs. Through digital technology, the platform increases transparency, communication and accessibility in the process of pet adoption and selling.

3.2 Requirement Analysis

The Zuffie: The Pet World system has been modelled like a web-based system whereby one can buy, sell and adopt pets besides giving donations to the NGOs that deal with animal welfare. An efficient performance of the system requires the presence of certain modules, infrastructure, and development environment.

Modules Involved in the System:

1) User Management Module: This module handles user registration, user login, and user management using a secure authentication.
2) Pet Listing Module: It allows pet owners and NGOs to post the information about the pets such as breed, age, description and photos.
3) Pet Search and Request Module: This module allows the customer to search on pet available and request it to the pet owner to adopt or buy it.

4) Request Management Module: It is the module through which pet owners can approve or disapprove requests by buyers.
5) NGO and Donation Module: This enabled the NGOs to post the information of animals that were rescued and also enables the users to make donations to help save animal lives.
6) Admin Module: This module allows the administrator to control the users, the listings of pets and the activities in the system.

Infrastructure Required

- Database and authentication database cloud-based backend service.
- Access to internet connectivity to access the platform.
- Database system to hold information on users, listings of pets and requests.
- Environmental Set up and IDE Configurations.
- Node.js development environment.
- Frontend built with Next.js, React, and TypeScript.
- Backend services offered with Supa base (PostgreSQL database, authentication, storage).
- The development was done on Visual Studio Code (VS Code) and with the required extensions.

Hardware Requirements (Minimum Configuration)

- Core: Intel Core i3 or other.
- RAM: 4 GB
- Storage: 256 GB
- Development and deployment Internet connection.

Software Requirements

- Operating System: windows, Linux or MacOS.
- Node.js runtime environment
- Application development in Next.js, React and TypeScript.
- Supa base as a backend service.●

IV. SYSTEM DESIGN

4.1 Proposed System Design –

Introduction The Zuffie - The Pet World is a web-based application that is designed in a centralized way to connect the pet owners, buyers, and NGOs. The suggested system will allow a user to see pets, request them to be adopted or purchased and talk to the owners of pets in a structured way. The system is designed keeping in mind simplicity, security and efficient handling of information related to pets. In the proposed system, users will be able to create profiles in order to use the system. Pets can be listed by pet owners and NGOs and this is done by keying in the necessary information including breed, age, description and photos. The users are able to see pets that are available and request the pet owners. The pet owner gets the request and is able to accept or reject it. The system also allows the donation option whereby the user can donate to NGOs dealing with animal welfare.

The system is designed in a modular fashion and individual modules are created to carry out certain activities like user management, pet listing, request management and donation support. The modular way also allows managing the system with ease and extending the system in the future.

4.2 System Architecture

The system will be based on a three-layer system, as discussed below:

- User Interface Layer:

In this layer, users will be able to interact with the system through a web interface, i.e., a web browser. The interface will be composed of various web pages for registration, logging in, viewing pets, submitting requests, and donating to an NGO, among others.

- Application Layer:

In this layer, the main logic of the system will be implemented. It will be in charge of handling requests from users, pet listing, request approval, as well as interacting with the database. This layer will ensure that all the system modules function as required.

- Database Layer:

In this layer, all critical information regarding users, pets, requests, donations, and others will be stored. The information will be stored in tables for easy management.

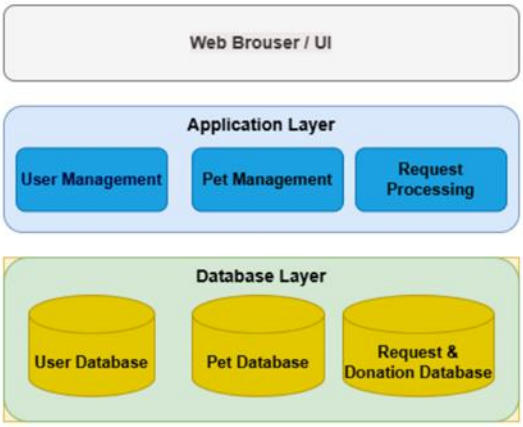

Figure 4.1 System Architecture

V. IMPLEMENTATION AND RESULTS

5.1 Introduction

The application of Zuffie: The Pet World is based on creating a practical and convenient application, which will enable users to purchase, sell, and adopt pets as well as contribute to the work of animal welfare organizations. The system is built with the latest web technologies including Next.js, React, and TypeScript to create the frontend interface and Tailwind CSS to create responsive and aesthetically-pleasing web pages. In the case of backend services, authentication, database storage, and real-time data management services are handled with Supa base. The technologies are synchronized in order to provide a fluent communication between the user interface and the database.

The implementation phase involved the creation of various modules of the system and their integration to give the needed functionalities. The key modules will be user authentication, pet listing, pet browsing and search pet request management and NGO donation management. The authentication module enables people to have accounts and to log into the system without any problems. The pet listing module helps pet owners or NGOs to enter the pet information whereas the browsing module helps users to see the availability of pets and the information about them. In cases where the user would be interested in a pet, the request module enables the user to send the request to the pet owner where he or she can accept or decline it via the system.

The outcomes of the implementation indicate that the platform is suitable in helping to address the primary objectives of the project. The system will also be easy to use and the users will be able to browse the available pets, make requests and don to NGOs. The owners of pets can manage their listings successfully and respond to requests proficiently, whereas the administrators can track the general activities of the system. The system is effective in data management and gives a well-organized platform which makes it easy to adopt pets and animal welfare programs.

5.2 Modules of the System

The system is subdivided into a number of modules to control various functionalities of the platform.

VI. CONCLUSION AND FUTURE WORK

6.1 Conclusion

The Zuffie - The Pet World platform has been set up to make the process of buying, selling and adopting pets easy and better for everyone buying a pet. The project has managed to bring together the users, pet owners and NGOs on one single platform where they can effectively interact with each other. The system enables the users to browse through the pets, send requests and confirmation from pet owners on offer and in an organized manner. The platform also supports animal welfare as it includes the donation feature for NGOs to promote responsible pet adoption and care. The application of new technologies such as Next-js, React, TypeScript and Supa base are ensuring that the system is efficient, scalable and simple to work with. The modular nature of the system makes it easy to manage different functionalities such as authentication, listing pets, managing requests, and processing donations.

All in all, the system fulfills the goals of being a reliable and effective solution to the problem of pet adoption and management. It entails fewer manual efforts and improved communication between the user and the pet owner and creates more transparency in the adoption process. The project is an excellent demonstration of the use of digital platforms that can be used successfully to find the solutions through real-world processes to animal welfare related problems.

6.2 Future Scope

Although the system is functional and efficient, there are several enhancements that can be implemented in the future to improve its capabilities.

- The platform can be extended into a mobile application for better accessibility and user convenience.
- Integration of AI-based recommendation systems can help users find suitable pets based on their preferences.
- A pet health tracking system can be introduced to maintain medical records of pets.
- Online payment gateway integration can be added for secure and direct donations.
- A rating and review system can be implemented to build trust among users and pet owners.
- The system can be expanded to include pet care services such as veterinary appointments and grooming services.

These enhancements will further improve the usability and effectiveness of the platform and make it more impactful in the field of pet adoption and animal welfare.
